## WATER - IT'S EVERYWHERE, BUT HOW MUCH OF IT DO WE WANT TO CARRY IN OUR ROPES?

After carrying literally tons of rope over the years, I have noticed a difference in the weight of similar lengths of rope, not just between thicknesses, but between materials as well. Some ropes feel like they hold a lot more water than others. I have also noticed that some ropes take a lot longer to dry, even in summer.
I have been told on numerous occasions that Polyester absorbs less water then Polyamide. I have no idea why, so I thought I would put it to the test. The ropes are a bit random, but hopefully some information will be gained from this simple test.

## Test Details:

Weather Conditions - Humidity approx $80 \%$. Temperature range from around 8-15 degrees Celcius. Hanging under shelter, in the shade.
Testing Method - Cut 1 metre lengths of rope. Weigh dry rope. Saturate rope - fully immersed for 1 hour. Re-weigh saturated rope. Reweigh at intervals. Kitchen scales were used to weigh the rope. Each measure was checked twice.

Ropes hung vertically - see photos. (I know you are not going to carry your rope like this, but this is how I chose to do it for the experiment!)

I used these ropes because they are what I had available.

## ROPE WEIGHT COMPARISON - POLYESTER VS POLYAMIDE (OLD + NEW)

| ROPE TYPE | ROPE | DRY | WET | DRIP DRY 30 MINS | DRIP DRY 15 HRS | DRIP DRY 24 HRS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| POLYAMIDE (NYLON) | Kordas Dana 9mm Canyon Rope (used 50 + times, two years old) | 60 gms | $\begin{gathered} 82 \mathrm{gms} \\ +36.66 \% \end{gathered}$ | $\begin{gathered} 80 \mathrm{gms} \\ +33.33 \% \end{gathered}$ | $\begin{gathered} 74 \mathrm{gms} \\ +23.33 \% \end{gathered}$ | 63 gms $+5 \%$ |
|  | Kordas Dana 10mm Canyon Rope (new) | 72gms | $\begin{gathered} 86 \mathrm{gms} \\ +19.44 \% \end{gathered}$ | $\begin{gathered} 85 \mathrm{gms} \\ +18.05 \% \end{gathered}$ | 81gms $+12.05 \%$ | $\begin{gathered} 76 \mathrm{gms} \\ +5.55 \% \end{gathered}$ |
|  | Beal 11mm Climbing Rope (20 years old) retired | 71 gms | $\begin{gathered} \text { 92gms } \\ +29.57 \% \end{gathered}$ | $\begin{gathered} 85 \mathrm{gms} \\ +19.71 \% \end{gathered}$ | $\begin{gathered} 80 \mathrm{gms} \\ +12.67 \% \end{gathered}$ | $\begin{aligned} & 72 \mathrm{gms} \\ & +1.4 \% \end{aligned}$ |
| POLYESTER | Stirling HTP 9mm (used 50 + times, two years old) | 67 gms | $\begin{gathered} 90 \mathrm{gms} \\ +34.32 \% \end{gathered}$ | $\begin{gathered} 89 \mathrm{gms} \\ +32.83 \% \end{gathered}$ | $\begin{gathered} \text { 82gms } \\ +22.38 \% \end{gathered}$ | $\begin{gathered} 71 \mathrm{gms} \\ +5.97 \% \end{gathered}$ |
|  | Donaghys - Abseil Braid 10mm (10 years old) | 96 gms | $\begin{gathered} 132 \mathrm{gms} \\ +37.50 \% \end{gathered}$ | $\begin{array}{r} 125 \mathrm{gms} \\ +30.20 \% \end{array}$ | $\begin{gathered} 119 \mathrm{gms} \\ +23.95 \% \end{gathered}$ | 105gms +9.37\% |

Percentage weight gain from original weight - shown in red for each rope.

## Points of Interest :

- In all cases the nylon rope drained faster than the polyester rope. (It would have been good to have some new HTP rope)
- Interestingly, the Beal dynamic rope drained the fastest - it is polyamide.
- The Kordas Dana 9 started off 11.66\% lighter than the Stirling HTP (I was surprised).
- The 10 mm dry treated new Kordas is actually lighter than the 9 mm HTP when wet.
- Both Kordas ropes are dry treated (the 9 mm is 2 years old, so there is some loss of 'dry treatment' over time).
- The Donaghy's rope is nearer 10.5 mm , although advertised as 10 mm . This polyester rope added the highest proportional weight.
- My thoughts are that there is a correlation between the density of a rope, the quantity of water it holds, and how fast it drains.
- A more thorough test could be very interesting. There are lots of variants - if you have a selection of new and old ropes + some spare time ......

Rope getting a thorough wetting before initial weighing.

Hanging up to drip dry before weighing at regular intervals.
